# PenRad™ DQC
Digital QC for Breast Centers

PenRad's next generation Digital QC (DQC) system automates the process of recording and calculating QA/QC data for the digital breast imaging environment. DQC tracks all FFDM, MRI and stereo modalities, as well as all reading workstations and film printers, based on guidelines established by the manufacturer and/or MQSA. Continuing Education (CE and CME) credits are also tracked.

As an electronic enterprise wide solution, DQC provides centralized records thus eliminating binders and clipboards at multiple locations. The DQC application can be accessed throughout the network, as a web hosted solution or installed on a laptop.

The DQC Quick-View worklist provides Auto-Remind and One-Glance technology to display the current status of all of devices and CE reminders. As QC recording is completed the status indicator displays green indicating the task is current, yellow indicates due shortly and red is due or past-due. For convenience, devices can be displayed and filtered on the worklist by location, device type and/or theme.

Multiple advanced features are integrated into each device recording template such as Variance-Alert to instantly notify when parameters are exceeded, automatic calculations and prepopulation of inherited baseline values and other key information, thus eliminating redundant entry.

The DQC system adds significant meaningful use to your breast imaging facility by standardizing and automating QC, offering centralized electronic access, and minimizing preparation for the MQSA audit.

With DQC, facilities can collect, retrieve and produce comprehensive MQSA audit reports instantaneously with minimal effort.

Device QC logs and audit reports are viewed/printed in rich graphical formats.

As modality technology and regulations evolve, PenRad provides software upgrades at no charge.

PenRad offers many solutions to advance professional productivity and reduce expenses for breast imaging. With our PenTrac and PenReader solutions, facilities track patient studies, generate patient exam and reminder letters, along with the MQSA audit reports. Our full featured PenView and Compass visualization software solutions provide radiologists increased productivity at a modest offering.
