

Eliminate the need for data entry by Radiologists and Technologists. PenAutoReader.

Does your Mammography Information System automatically track MQSA data?

With the exclusive PenAutoReader system the radiologist continues to dictate or use voice recognition for narrative reports while the system automatically extracts exam information from the reports. The exclusive PenAutoReader utilizes adaptive learning and pattern recognition technology to eliminate manual data input.

Pertinent tracking information such as exam type, letter type, recall interval and BI-RADS are automatically extracted and stored for MQSA audit, tracking, statistics and unresolved case report generation.

PenAutoReader adapts to each radiologist by each exam type to enhance data extraction automatically and eliminates the need for manual entry of tracking data. The system frees radiologists and staff from entering information for tracking and statistical analysis.

The PenAutoReader is another EXCLUSIVE module from PenRad, the Mammography Information System market leader.
