

Another PenRad solution that proves again that time is money. PenFetchPlus.

No other Mammography Information System can offer you this solution.

The PenFetchPlus image check and retrieve module allows facilities to locate and then retrieve images from the PACs automatically in the background. The module automatically identifies prior studies required for comparison and facilitates transfer of images to a CD/DVD burner for outside requests. Allows tele-mammography radiologists to pull studies to workstation.

Generates pick-list for comparison
Checks availability in multiple PACs
Transfers images to CD/DVD burner

Transfers priors to workstations
Optimizes LANs, WANs and networks
Eliminates manual image transfer

The PenFetchPlus works in conjunction with our PenFetch module to allow the bulk transfer of images after hours, freeing up the network for real-time transfer. It checks workstations first for images prior to move. The module contributes to staff utilization and removes dependencies of IT staff to create CD/DVD for outside requests.
